

Gate Driver Providing Galvanic isolation Series
Isolation voltage 2500Vrms

1ch Gate Driver Providing Galvanic Isolation

BM60013FV-C

● **General Description**

The BM60013FV-C is a gate driver with isolation voltage 2500Vrms, I/O delay time of 200ns, and minimum input pulse width of 100ns, and incorporates the fault signal output functions, undervoltage lockout (UVLO) function, thermal protection function, and short current protection (SCP, DESAT) function.

● **Features**

- Providing Galvanic Isolation
- Active Miller Clamping
- Fault signal output function (Adjustable output holding time)
- Undervoltage lockout function
- Thermal protection function (Adjustable threshold voltage)
- Short current protection function (Adjustable threshold voltage)
- Soft turn-off function for short current protection

● **Key Specifications**

- Isolation voltage: 2500 [Vrms] (Min.)
- Maximum gate drive voltage: 20 [V] (Max.)
- I/O delay time: 200 [ns] (Max.)
- Minimum input pulse width: 100 [ns] (Max.)

● **Package**

SSOP-B20W

W(Typ.) x D(Typ.) x H(Max.)

6.50 mm x 8.10 mm x 2.01 mm

● **Applications**

- Automotive isolated IGBT/MOSFET inverter gate drive
- Automotive DC-DC converter
- Industrial inverters systems
- UPS systems

● **Typical Application Circuits**

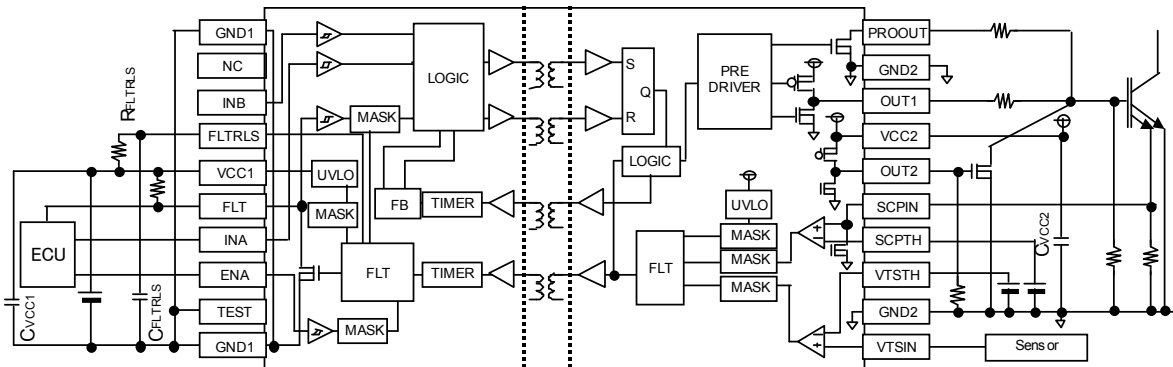

Figure 1. For using 4-pin IGBT (for using SCP function)

Figure 2. For using 3-pin IGBT (for using DESAT function)

●Recommended range of external constants

Pin Name	Symbol	Recommended Value			Unit
		Min.	Typ.	Max.	
FLTRLS	CFLTRLS	-	0.01	0.47	uF
	RFLTRLS	50	200	1000	kΩ
VCC1	C _{VCC1}	0.1	1.0	-	uF
VCC2	C _{VCC2}	0.33	-	-	uF

●Pin Configuration

Figure 3. Pin configuration

●Pin Description

Pin No.	Pin Name	Function
1	VTSIN	Thermal detection pin
2	GND2	Output-side ground pin
3	VTSTH	Thermal detection threshold setting pin
4	SCPTH	Short current detection threshold setting pin
5	SCPIN	Short current detection pin
6	OUT2	MOS FET control pin for Miller Clamp
7	VCC2	Output-side power supply pin
8	OUT1	Output pin
9	GND2	Output-side ground pin
10	PROOUT	Soft turn-off pin
11	GND1	Input-side ground pin
12	NC	No Connect
13	INB	Invert / non-invert selection pin
14	FLTRLS	Fault output holding time setting pin
15	VCC1	Input-side power supply pin
16	FLT	Fault output pin
17	INA	Control input pin
18	ENA	Input enabling signal input pin
19	TEST	Test mode setting pin
20	GND1	Input-side ground pin

●Description of pins and cautions on layout of board

- 1) VCC1 (Input-side power supply pin)
The VCC1 pin is a power supply pin on the input side. To suppress voltage fluctuations due to the current to drive internal transformers, connect a bypass capacitor between the VCC1 and the GND1 pins.
- 2) GND1 (Input-side ground pin)
The GND1 pin is a ground pin on the input side.
- 3) VCC2 (Output-side power supply pin)
The VCC2 pin is a power supply pin on the output side. To reduce voltage fluctuations due to OUT1, OUT2 pin output current and due to the current to drive internal transformers, connect a bypass capacitor between the VCC2 and the GND2 pins.
- 4) GND2 (Output-side ground pin)
The GND2 pin is a ground pin on the output side. Connect the GND2 pin to the emitter / source of a power device.
- 5) IN (Control input terminal)
The IN pin is a pin used to determine output logic.

ENA	INB	INA	OUT1
L	X	X	L
H	L	L	L
H	L	H	H
H	H	L	H
H	H	H	L

- 6) FLT (Fault output pin)
The FLT pin is an open drain pin used to output a fault signal when a fault occurs (i.e., when the undervoltage lockout function (UVLO), short current protection function (SCP) or thermal protection function is activated). This pin is I/O pin and if L voltage is externally input, the output is set to L status regardless of other input logic. Consequently, be sure to connect the pull-up resistor between VCC1 pin and the FLT pin even if this pin is not used.

Pin	FLT
While in normal operation	Hi-Z
When an Fault occurs (When UVLO, SCP or thermal protection is activated)	L

- 7) FLTRLS (Fault output holding time setting pin)
The FLTRLS pin is a pin used to make setting of time to hold a fault signal. Connect a capacitor between the FLTRLS pin and the GND1 pin, and a resistor between it and the VCC1 pin. The fault signal is held until the FLTRLS pin voltage exceeds a voltage set with the VFLTRLS parameter. To set holding time to 0 ms, do not connect the capacitor. Short-circuiting the FLTRLS pin to the VCC1 pin will cause a high current to flow in the FLTRLS pin and, in an open state, may cause the IC to malfunction. To avoid such trouble, be sure to connect a resistor between the FLTRLS and the VCC1 pins.
- 8) OUT1 (Output pin)
The OUT1 pin is a pin used to drive the gate of a power device.
- 9) OUT2 (MOS FET control pin for Miller Clamp)
The OUT2 pin is a pin for controlling the external MOS switch for preventing increase in gate voltage due to the miller current of the power device connected to OUT1 pin.
- 10) PROOUT (Soft turn-off pin)
The PROOUT pin is a pin used to put the soft turn-off function of a power device in operation when the SCP function is activated. This pin combines with the gate voltage monitoring pin for Miller Clamp function.
- 11) SCPIN (Short current detection pin), SCPTH (Short current detection threshold setting pin)
The SCPIN pin is a pin used to detect current for short current protection. When the SCPIN pin voltage exceeds a voltage set with the SCPTH pin voltage, the SCP function will be activated. This may cause the IC to malfunction in an open state. To avoid such trouble, short-circuit the SCPIN pin to the GND2 pin and SCPTH pin to the VCC2 pin if the short current protection is not used. In order to prevent the wrong detection due to noise, the noise mask time $t_{SCPMASK}$ is set.
- 12) VTSIN (Thermal detection pin), VTSTH (Thermal detection threshold setting pin)
The VTSIN pin is a temperature sensor voltage input pin, which can be used for thermal protection of a power device. If VTSIN pin voltage becomes VTSTH pin voltage or less, OUT1 pin is set to L. In the open status, the IC may malfunction, so be sure to supply the VTSIN more than VTSTH if the thermal protection function is not used. In order to prevent the wrong detection due to noise, the noise mask time t_{TSMASK} is set.

●Description of functions and examples of constant setting

1) Miller Clamp function

When OUT1=L and PROOUT pin voltage < V_{OUT2ON} , H is output from OUT2 pin and the external MOS switch is turned ON.
 When OUT1=H, L is output from OUT2 pin and the external MOS switch is turned OFF. While the short-circuit protection function is activated, L is output from OUT2 pin and the external MOS switch is turned OFF.

Short current	SCPIN	IN (INA EXOR INB)	PROOUT	OUT2
Detected	Not less than V_{SCPTH}	X	X	L
Not detected	X	L	Not less than V_{OUT2ON}	L
	X	L	Less than V_{OUT2ON}	H
	X	H	X	L

Figure 4. Block diagram of Miller Clamp function

Figure 5. Timing chart of Miller Clamp function

2) Fault status output

This function is used to output a fault signal from the FLT pin when an fault occurs (i.e., when the undervoltage lockout function (UVLO), short current protection function (SCP) or thermal protection function is activated) and hold the fault signal until the set Fault output holding time is completed. The fault output holding time t_{FLTRLS} is given as the following equation with the settings of capacitor C_{FLTRLS} and resistor R_{FLTRLS} connected to the FLTRLS pin. For example, when C_{FLTRLS} is set to $0.01\mu F$ and R_{FLTRLS} is set to $200k\Omega$, the holding time will be set to 2 ms.

$$t_{FLTRLS} [ms] = C_{FLTRLS} [\mu F] \cdot R_{FLTRLS} [k\Omega]$$

To set the fault output holding time to "0" ms, only connect the resistor R_{FLTRLS} .

Status	FLT pin
Normal	Hi-Z
Fault occurs	L

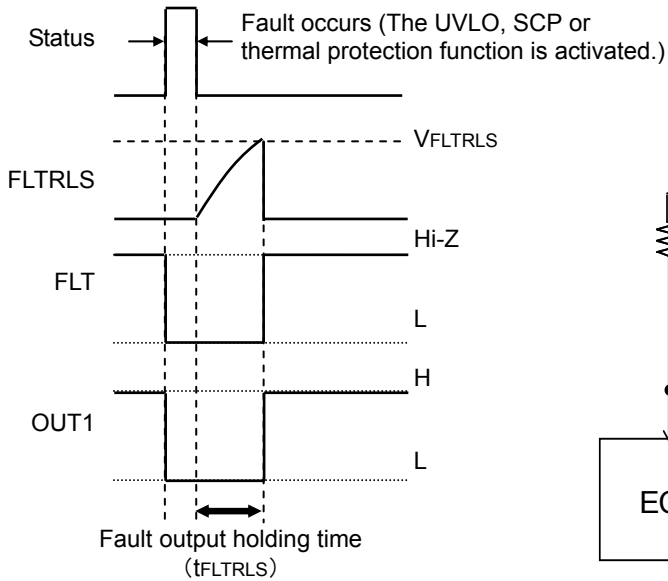

Figure 6. Fault Status Output Timing Chart

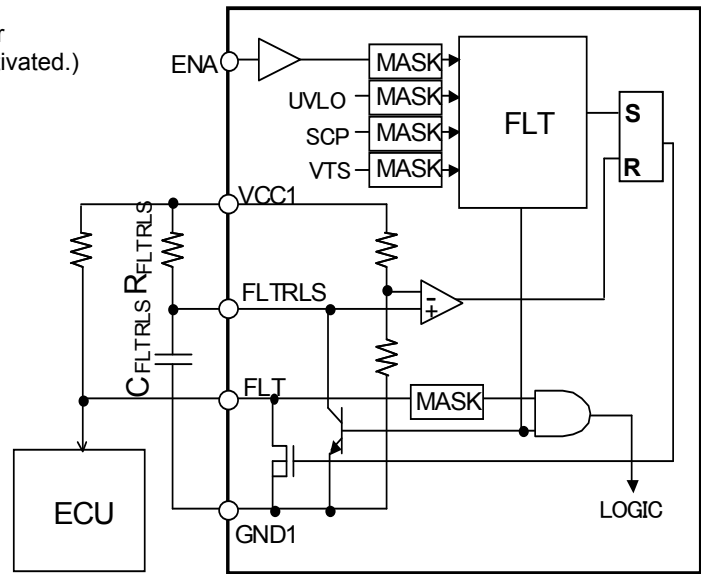

Figure 7. Fault Output Block Diagram

3) Undervoltage Lockout (UVLO) function

The BM60013FV-C incorporates the undervoltage lockout (UVLO) function both on the low and the high voltage sides. When the power supply voltage drops to the UVLO ON voltage, the OUT1 pin and the FLT pin both will output the "L" signal. When the power supply voltage rises to the UVLO OFF voltage, these pins will be reset. However, during the fault output holding time set in "2) Fault status output" section, the OUT1 pin and the FLT pin will hold the "L" signal. In addition, to prevent malfunctions due to noises, mask time $t_{UVLO1MSK}$ and $t_{UVLO2MSK}$ are set on both low and high voltage sides.

Figure 8. Input-side UVLO Function Operation Timing Chart

Figure 9. Output-side UVLO Operation Timing Chart

4) Short current protection function (SCP, DESAT)

When the SCPIN pin voltage exceeds a voltage set with the SCPTH pin voltage, the SCP function will be activated. When the SCP function is activated, the OUT1 pin voltage will be set to the "Hi-Z" level first, and then the PROOUT pin voltage to the "L" level (soft turn-off). Next, after t_{STO} has passed after the short-circuit current falls below the threshold value, OUT1 pin becomes L and PROOUT pin becomes Hi-Z. Finally, when the fault output holding time set in "2) fault status output" section on page 5 is completed, the SCP function will be released.

$V_{COLLECTOR}/V_{DRAIN}$ which Desaturation Protection starts operation (V_{DESAT}) and the blanking time (t_{BLANK}) can be calculated by the formula below;

$$V_{DESAT} [V] = V_{SCPTH} \cdot \frac{R3 + R2}{R3} - V_{FD1}$$

$$V_{CC2_MIN} [V] > V_{SCPTH} \cdot \frac{R3 + R2 + R1}{R3}$$

$$t_{BLANK\text{external}} [s] = -\frac{R2 + R1}{R3 + R2 + R1} \cdot R3 \cdot C_{BLANK} \cdot \ln\left(1 - \frac{R3 + R2 + R1}{R3} \cdot \frac{V_{SCPTH}}{V_{CC2}}\right) + 0.2 \cdot 10^{-6}$$

V _{DESAT}	Reference Value (In case of SCPTH=0.7V)		
	R1	R2	R3
4.0V	15 kΩ	39 kΩ	6.8 kΩ
4.5V	15 kΩ	43 kΩ	6.8 kΩ
5.0V	15 kΩ	36 kΩ	5.1 kΩ
5.5V	15 kΩ	39 kΩ	5.1 kΩ
6.0V	15 kΩ	43 kΩ	5.1 kΩ
6.5V	15 kΩ	62 kΩ	6.8 kΩ
7.0V	15 kΩ	68 kΩ	6.8 kΩ
7.5V	15 kΩ	82 kΩ	7.5 kΩ
8.0V	15 kΩ	91 kΩ	8.2 kΩ
8.5V	15 kΩ	82 kΩ	6.8 kΩ
9.0V	15 kΩ	130 kΩ	10 kΩ
9.5V	15 kΩ	91 kΩ	6.8 kΩ
10.0V	15 kΩ	130 kΩ	9.1 kΩ

●Power Dissipation

Figure 60. SSOP-B20W Derating Curve

●Thermal design

Please confirm that the IC's chip temperature T_j is not over 150°C , while considering the IC's power consumption (W), package power (P_d) and ambient temperature (T_a). When $T_j=150^{\circ}\text{C}$ is exceeded the functions as a semiconductor do not operate and some problems (ex. Abnormal operation of various parasitic elements and increasing of leak current) occur. Constant use under these circumstances leads to deterioration and eventually IC may destruct. $T_{j\text{max}}=150^{\circ}\text{C}$ must be strictly obeyed under all circumstances.

The IC's consumed power (P) can be estimated roughly with following equation.

$$P = V_{CC1} \cdot I_{CC1} + V_{CC2} \cdot I_{CC2} + I_{ON}^2 \cdot R_{ONH} \cdot t_{ON} \cdot f_{PWM} + I_{OFF}^2 \cdot R_{ONL} \cdot t_{OFF} \cdot f_{PWM}$$

f_{PWM} : PWM frequency

I_{ON} : OUT1 pin outflow current when OUT1 is H state.

t_{ON} : Current outflow time from OUT1 pin when OUT1 is H state.

I_{OFF} : OUT1 pin inflow current when OUT1 is L state.

t_{OFF} : Current inflow time to OUT1 pin when OUT1 is L state.

●Operational Notes

- (1) Absolute maximum ratings
An excess in the absolute maximum ratings, such as supply voltage, temperature range of operating conditions, etc., can break down the devices, thus making impossible to identify breaking mode, such as a short circuit or an open circuit. If any over rated values will expect to exceed the absolute maximum ratings, consider adding circuit protection devices, such as fuses.
- (2) Connecting the power supply connector backward
Connecting of the power supply in reverse polarity can damage IC. Take precautions when connecting the power supply lines. An external direction diode can be added.
- (3) Power supply Lines
Design PCB layout pattern to provide low impedance GND and supply lines. To obtain a low noise ground and supply line, separate the ground section and supply lines of the digital and analog blocks. Furthermore, for all power supply terminals to ICs, connect a capacitor between the power supply and the GND terminal. When applying electrolytic capacitors in the circuit, not that capacitance characteristic values are reduced at low temperatures.
- (4) GND Potential
The potential of GND1 pin must be minimum potential in all operating conditions. (Input side ; 11pin to 20pin)
The potential of VEE2 pin must be minimum potential in all operating conditions. (Output side ; 1pin to 10pin)
- (5) Thermal design
Use a thermal design that allows for a sufficient margin in light of the power dissipation (Pd) in actual operating conditions.
- (6) Inter-pin shorts and mounting errors
When attaching to a printed circuit board, pay close attention to the direction of the IC and displacement. Improper attachment may lead to destruction of the IC. There is also possibility of destruction from short circuits which can be caused by foreign matter entering between outputs or an output and the power supply or GND.
- (7) Operation in a strong electric field
Use caution when using the IC in the presence of a strong electromagnetic field as doing so may cause the IC to malfunction.
- (8) Inspection of the application board
During inspection of the application board, if a capacitor is connected to a pin with low impedance there is a possibility that it could cause stress to the IC, therefore an electrical discharge should be performed after each process. Also, as a measure against electrostatic discharge, it should be earthed during the assembly process and special care should be taken during transport or storage. Furthermore, when connecting to the jig during the inspection process, the power supply should first be turned off and then removed before the inspection.
- (9) Input terminal of IC
Between each element there is a P+ isolation for element partition and a P substrate. This P layer and each element's N layer make up the P-N junction, and various parasitic elements are made up.

- When GND > (Terminal A) at the resistance and GND > (Terminal B) at the transistor (NPN), the P-N junction operates as a parasitic diode.
- Also, when GND > (Terminal B) at the transistor (NPN), The parasitic NPN transistor operates with the N layers of other elements close to the aforementioned parasitic diode.

Because of the IC's structure, the creation of parasitic elements is inevitable from the electrical potential relationship. The operation of parasitic elements causes interference in circuit operation, and can lead to malfunction and destruction. Therefore, be careful not to use it in a way which causes the parasitic elements to operate, such as by applying voltage that is lower than the GND (P substrate) to the input terminal.

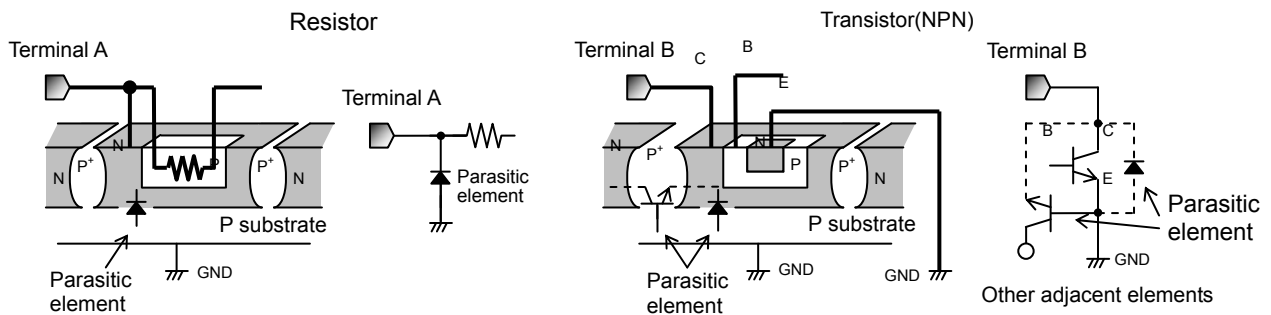

Figure 61. Pattern Diagram of Parasitic Element

- (10) Ground Wiring Patterns
When using both small signal and large current GND patterns, it is recommended to isolate the two ground patterns, placing a single ground point at the application's reference point so that the pattern wiring resistance and voltage variations caused by large currents do not cause variations in the small signal ground voltage. Be careful not to change the GND wiring pattern potential of any external components, either.
